

## Competition

There aren't that many specific dev journals out there. Most devs end up reusing a regular journal app as a dev journal.

Some examples are:

- Notion
- Obsidian
- Dayone

These apps all have support for **Markdown** for inputting and editing journal entries.

### Day One

Positive:

- password protected (security)
- allows option of multiple journals
- able to add images
- tracks how many days in a row you've journaled
- tag feature
- sends reminder to journal each day

Negative:

- date is too small
- date and time should be in a darker font

### Git Journal

Positive:

- interface intuitive and clean

Negative:

- buggy
  - files sometimes not visible
  - slow loading time

### Red Notebook

Positive:

- keyword search

Negative:

- Lack of security
- not accessible on all devices
- very basic/plain interface
- no easy way to navigate through entries

### Journey-Diary, Journal

Positive:

- able to add tags to entries
- templates to select from
- able to upload photos/audio recordings

Negative:

- unable to title entries
- no way to categorize entries
